Background

As the world becomes increasingly mobile-centric, the decision between developing a website or a mobile app is a crucial one for businesses and developers. The choice between a website and a mobile app can significantly impact user engagement and business success.

C7 Projects is a web application developed for project management and includes modules for planning, calculating, reporting, invoicing and more. Some parts should probably be offered as a mobile app.

Description

The thesis will explore the challenges and the benefits of mobile apps, such as offline access and superior performance. Discuss the necessity and strategies for developing different apps for various devices. The thesis can focus on an investigation of the criteria for selecting parts of our C7 Projects web to be converted into apps. Another interesting option is how to develop a framework for the transition process, including technical considerations and maintenance.

Result

The thesis should result in a report with suggestions for how to proceed with mobile apps for C7 Projects.

Budget

Triona supplies a supervisor and assures that the students have appropriate tools (computer etc.) and a workplace.
